The skills are free. The runtime is metered.

Nothing here is a license purchase. The cost is Copilot Credits consumed when a skill runs, and the lever is the spending policy.

What this costs

- These 23 skills cost nothing. MIT license, no purchase, no subscription, no email required.
- What costs money is Cowork itself, which bills Copilot Credits on usage.
- Model responses, tool and skill calls, image generation and browser tasks all consume credits.
- There is no per-skill fee. A skill is a text file; running it is what meters.

Where the control sits

- A spending policy in Microsoft 365 admin center, Copilot, Cost management.
- Limits can be set per tenant, per group or per user.
- That policy is also the access control. Any user in scope can use Cowork however small the limit.
- Enforcement is asynchronous, so treat a cap as a boundary, not a hard stop.

What moves the number

- Reasoning effort, which sits next to the model picker and defaults to Medium.
- Which model runs. Auto is the default and picks for the task.
- Scheduled prompts, because they run whether or not anyone needed them that week.
- Type /cost in a session to see usage so far.

The budgeting mistake to avoid

- A user can hold 50 custom skills but only 25 scheduled prompts.
- Skills are free to hold and cost nothing until invoked.
- Schedules are the recurring line, because each one runs on a clock regardless of need.
- Every skill here runs on demand by default. A schedule is opt-in, per skill.

The honest version of the business case.
These skills remove preparation time, not decisions. Every one drafts and stops, which means a person still reads the output. Any saving that assumes nobody reviews the result is not a saving this catalog supports.
